

Table 21: Prompt used to extract topic from real paper

You are a research expert tasked with extracting the main topic from the provided paper information.

The main topic should encompass broad fields such as "Retrieve augment generation" or "using diffusion models for video generation". However, it should also include a relevant task to the topic, formatted as "topic:... task:...".

Please read the provided paper and extract only the topic, which should follow this structure.

The paper's title is **[Title]**

The paper's abstract is as follows: **[Abstract]**

The paper's introduction is as follows: **[Introduction]**

Please output strictly in the following format:

topic: ...

Table 22: Prompt used to extract idea from real paper

You are a research expert tasked with extracting the main idea from the provided paper information.

The main idea should encompass the motivation, solved problem, novelty, method of the paper.

Please read the provided paper and extract the main idea from the paper.

The paper content is as follows: **[Content]**

Idea is composed of the following components:

Motivation: Explain the background of the idea and past related work, identify the shortcomings of past work, identify the problems that need improvement, and identify the issues the paper want to address.

Novelty: Explain the differences between the method and the current method (preferably list specific methods), explain what improvements the paper have made to the previous method, and then identify the problems that can be solved and the benefits that can be gained from these improvements.

Method: Provide a detailed description of your idea, including the core method, the problem it solves, and the improvement compared with previous work (Cite the previous work with the title of the paper). Explain the specific steps of the method, the specific functions of each module, and the specific reasons why this method can solve the previous problem.

Here are some tips for extracting the main idea:

1. Make idea easy to understand, use clear and concise language to describe, assuming the reader is someone who has few knowledge of the subject, avoid using complex technical terms, and try to use easy-to-understand terms to explain. If the paper use some professional terms, please explain them in detail.
2. When the paper cite other papers, please indicate the title of the original paper.

The final idea should be detailed and specific, clearly explain the origins, motivation, novelty, challenge, solved problem and method of the paper, and detail how the overcame these hurdles. Ensure your approach is innovative, specifying how this innovation is reflected in your experimental design.

The final idea should be double-blind, i.e. no experimental results or codes should be shown.

Please output strictly in the following format:

Final idea: ...

Table 23: Prompt used to extract experiment from real paper

You are a research expert tasked with extracting the specific experiment steps from the provided paper information.

The specific experiment steps should include the specific methods for each step.

Please read the provided paper and extract specific experiment steps from the paper.

The paper content is as follows: **[Content]**

There are some tips for extracting the experiment steps:

1. Detail the Experimental Process: Describe the entire experimental process, including how to construct the dataset and each specific experimental step. Ensure that each experimental method is clearly and thoroughly detailed.
2. If specific technologies are involved in the experimental design, describe the implementation process in as much detail as possible (i.e., technical details)
3. Make sure your experimental plan is concise and clear, and can be easily understood by others, should not be too complicated.
4. Please provide a detailed explanation of the baseline used in the paper, the comparative methods, the ablation design and the experimental design. Specifically, elaborate on how these elements collectively support and validate the conclusions drawn in your research.
5. Explain how your experimental design can help you verify the idea and how the experiment is detailed and feasible.

Now please output strictly in the following format:

Experiment:

Step1: ...

Step2: ...

...
